Healthcare Consultation, Pharmacy & Diagnostics Platform

Document	Client Operations & Administration Guide
Version	1.0
Date	15 October 2026
Audience	Platform administrators & operations team

CONFIDENTIAL — Prepared for the client. Not for public distribution.

1. Welcome to PRANOVA

PRANOVA is a headless, API-first healthcare platform. A single secure backend powers three clients: a web **Admin Console** for your operations team, and native mobile apps for **Patients** and **Care Managers**. This guide explains how your team runs the platform from the Admin Console.

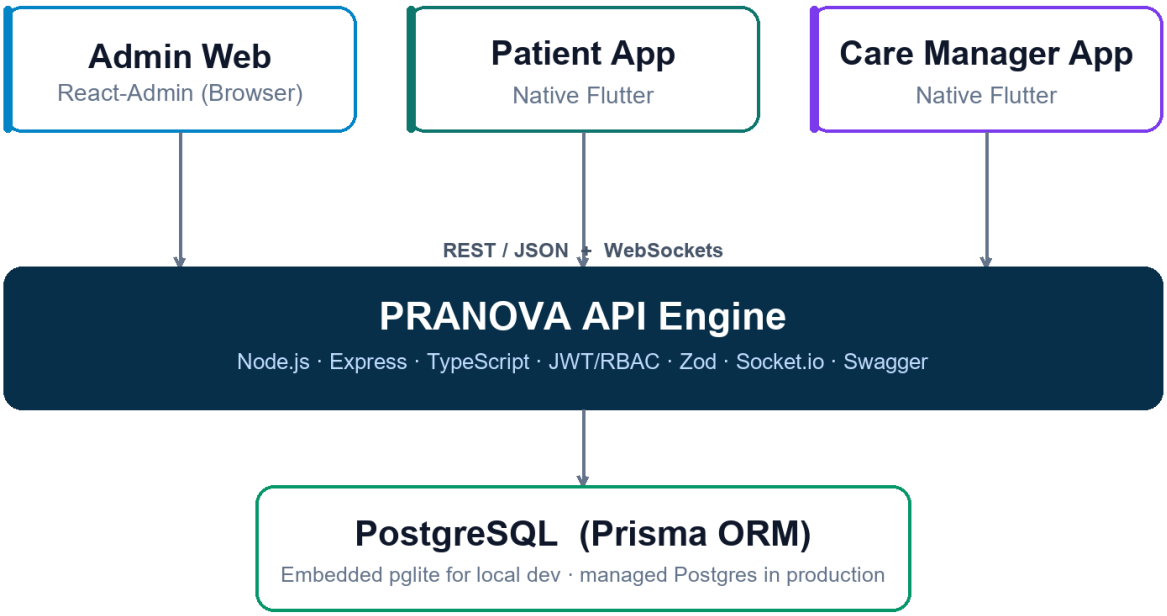

What the platform does

- **Doctor consultations & appointments** — patients find doctors by specialty and book video, audio, or in-clinic visits. Tele-consults get a secure video room automatically.
- **Online pharmacy** — a medicine catalogue with cart, server-priced orders, stock control, and an order-fulfilment workflow.
- **Diagnostics** — a diagnostic-test catalogue with home-collection or lab-visit bookings and report delivery.
- **Care coordination** — emergency SOS cases, care-manager dispatch, providers, and a tamper-proof audit trail.

> **At a glance:** everything your team manages — doctors, appointments, medicines, orders, tests, lab bookings, patients, and compliance — lives in one console, in real time.

2. How the Platform is Built

All clients talk to one central API over secure REST and WebSockets. Business data is stored in PostgreSQL. This keeps the apps light and ensures every channel shows the same, consistent information.

For local demos the database runs embedded inside the server (zero install). **On a production server** you connect a standard **PostgreSQL** database — not MySQL. Only the database connection string changes; no code changes are required.

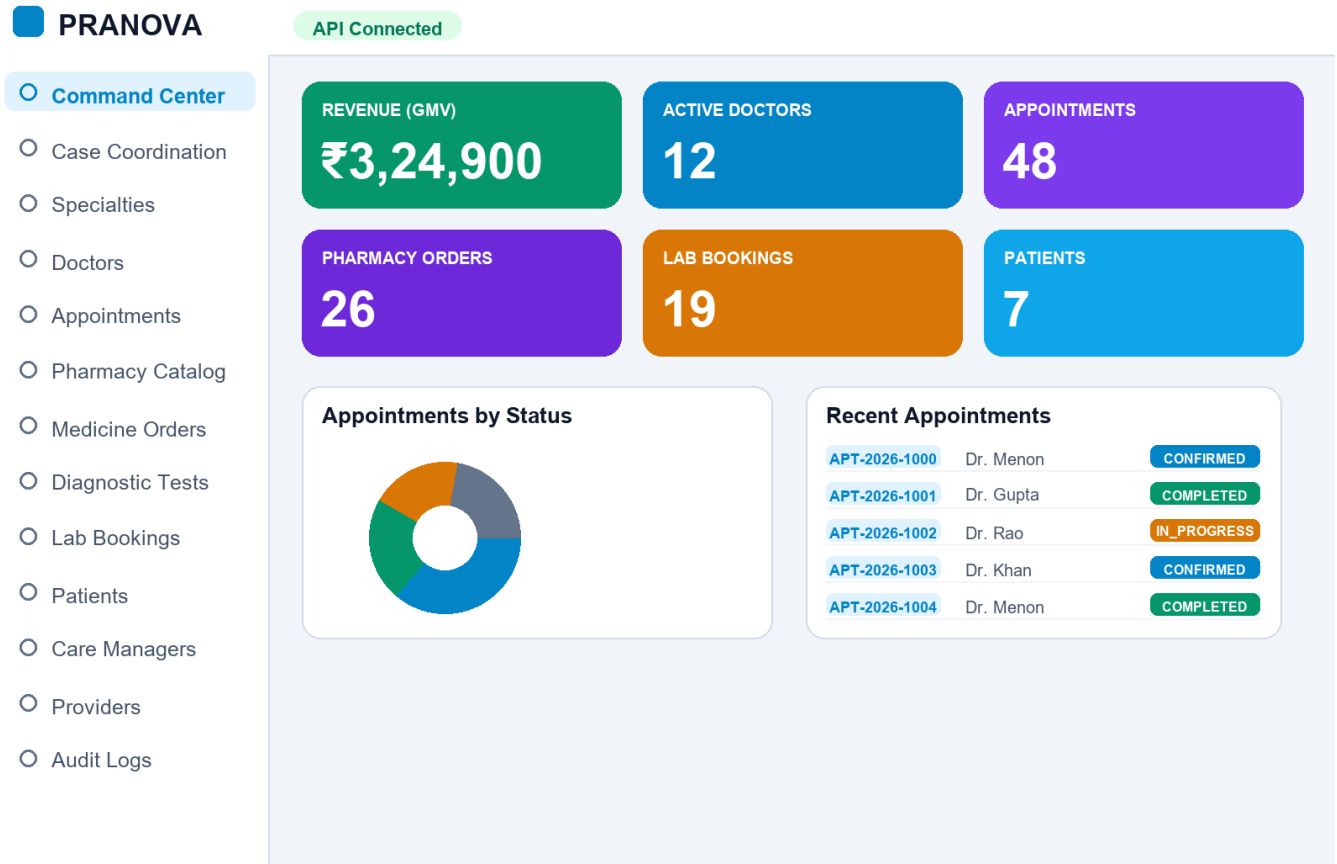

3. Accessing the Admin Console

- Open the Admin Console in your browser at your deployment URL (local: **http://localhost:5173**).
- Sign in with your administrator email and password.
- You will land on the **Command Center** dashboard.

> **First-time security step:** change the default administrator password immediately after your first sign-in, and create individual admin accounts for each team member so the audit trail attributes every action to the right person.

4. The Command Center Dashboard

The dashboard gives you a live, at-a-glance view of the whole platform. Click any tile to jump straight to that section.

What the tiles mean

- **Revenue (GMV)** — combined value of consultations, pharmacy orders, and diagnostics.
- **Active Doctors** — doctors currently accepting patients.
- **Appointments** — total booked, with today's consultations highlighted.

- **Pharmacy Orders** — total orders, with how many are still being fulfilled.
- **Lab Bookings** — diagnostic tests booked by patients.
- **Registered Patients** — patients onboarded to the platform.

Below the tiles, the **Appointments by Status** chart and **Recent Appointments** table let you spot what needs attention. Use **Refresh** to pull the latest numbers.

5. Managing Your Platform

5.1 Specialties & Doctors

- **Specialties** — create the medical categories patients browse (e.g. Cardiology, Dermatology).
- **Doctors** — add a doctor, assign a specialty, set video and in-clinic fees, qualifications, languages, and photo.
- Open a doctor to set **weekly availability slots** and switch status between Active, On Leave, and Inactive.

5.2 Appointments & Video Consultations

Status	What it means	Who sets it
Requested	Patient has requested a slot.	System / Patient
Confirmed	Booking confirmed; video room issued for tele-consults.	System / Admin
In Progress	Consultation is underway.	Admin / Clinician
Completed	Consultation finished; prescription note can be added.	Admin / Clinician
Cancelled / No-show	Visit cancelled or the patient did not attend.	Admin / Patient

Open any appointment to view the patient, doctor, schedule, fee, and the secure **video room link** for tele-consultations.

5.3 Pharmacy — Medicines & Orders

Status	What it means	Who sets it
Placed	Order received; totals and stock reserved automatically.	System
Confirmed	Order accepted for fulfilment.	Admin
Packed	Items packed and ready to dispatch.	Admin
Out for Delivery	Order is on its way to the patient.	Admin
Delivered	Order delivered; marked paid.	Admin
Cancelled	Order cancelled; stock is automatically restored.	Admin

Prices and totals are always calculated on the server, so the amount charged can never be tampered with from the app. Add and price catalogue items under **Pharmacy Catalog**.

5.4 Diagnostics — Tests & Lab Bookings

Status	What it means	Who sets it
Booked	Patient has booked a test (home collection or lab visit).	System / Patient
Sample Collected	Sample taken from the patient.	Admin / Lab
Processing	Sample is being analysed.	Admin / Lab
Report Ready	Report attached and available; marked paid.	Admin / Lab
Cancelled	Booking cancelled.	Admin / Patient

5.5 Coordination & Compliance sections

- **Patients, Care Managers, Providers** — directories your team maintains.
- **Case Coordination** — emergency SOS and care cases, with priority and assignment.
- **Audit Logs** — a read-only, tamper-proof record of every administrative action.

6. The Patient Mobile Experience

For context, here is what a patient does in the mobile app — all powered by the same backend you manage.

Everything the patient does (bookings, orders, lab tests) appears in your Admin Console in real time, so your team can act on it immediately.

7. Security & Compliance

- **Role-based access** — admin, patient, and care-manager permissions are strictly separated; mobile endpoints and admin endpoints never mix.
- **Signed sessions** — every request is authenticated with a signed token that expires automatically.
- **Server-side validation** — all data is validated on the server before it is saved.
- **Immutable audit trail** — audit and case-history records can never be edited or deleted.

8. Notes for Your Technical Team

- **Database:** PostgreSQL. Point the **DATABASE_URL** at a managed or self-hosted Postgres for production (no MySQL required).
- **One configuration file:** a single root **.env** (Bagisto-style) configures both the backend and the Admin Web client. Only keys prefixed **VITE_** are exposed to the browser.
- **API documentation (Swagger):** available only when **ENABLE_SWAGGER=true** and never linked from the UI. The explorer URL lives only in **.env** (**SWAGGER_URL**). Set **ENABLE_SWAGGER=false** for production and the route is disabled.
- **Scaling:** the API is stateless behind the database, so it scales horizontally; move from the embedded dev database to managed Postgres for concurrent load.

Appendix A — First-Login Checklist

- Sign in to the Admin Console.
- Change the default administrator password.
- Create individual admin accounts for your team.
- Add your Specialties, then onboard Doctors and set their availability.
- Load the Pharmacy Catalog and Diagnostic Tests.
- Confirm the dashboard shows live numbers.

Appendix B — Support

For configuration, deployment, or integration questions, contact your PRANOVA engineering partner. Keep this document confidential.
